APPENDICES

Survey Methods Questionnaires

1.0 Introduction

Environics Research Group Limited was commissioned by Health Canada to conduct a survey of Canadian youth, including youth smokers and non-smokers. The main objective of the survey was to provide information to assist in the evaluation of the impact of health warning messages on tobacco packaging on youth knowledge and behaviours. These health warning messages began appearing on the major tobacco brands in Canada on approximately January 1, 2001 and on all brands by approximately June 30.

The survey assessed sources of information about the effects of tobacco, awareness and knowledge of the health effects of tobacco, the extent to which specific diseases are believed to be caused by tobacco and the number of deaths caused by smoking. As well, it looked at perceptions of the health effects of chemicals or toxic substances in cigarettes, particularly hydrogen cyanide. The survey also measured awareness and recall of the warning messages on both the exterior of the packages and on the package slides and inserts, their effect on knowledge and behaviours, including behaviours intended to avoid the labels. Finally, it examined awareness of chemicals or toxic substances present in cigarettes, and recall of the information on toxic chemicals printed on the side of cigarette packages.

A survey of adults and adult smokers was conducted separately and is discussed under separate cover.

One goal of these surveys, conducted in November and early December of 2004, was to conduct the sampling and questionnaire design in such a manner as to allow comparison with eight previous waves of surveys conducted by Environics: baseline surveys, which were conducted in November and December 2000 prior to the introduction of new health warning messages into the marketplace; surveys conducted in March and April 2001, a few months after new health warning messages were first introduced into the marketplace; surveys conducted in July 2001, after new labels had appeared on all brands; and tracking surveys conducted in November and December 2001, July 2002, December 2002, July and August 2003, and December 2003.

The survey of youth aged 12 to 18 years, which included youth smokers and non-smokers, is based on a sample size of 1,000. This survey was conducted between November 18 and December 5, 2004. A survey based on a sample of 1,000 has a margin of error of approximately 3.1 percentage points, 19 times in 20.

This report summarizes the findings of the research. In the tables included in this report, we present results for the general population (GP), smokers (S) and potential smokers (PS). The sample sizes of these groups are:

General population: 1,000 Smokers: 117 Potential smokers: 271

Appended to this report are copies of the English and French questionnaires and a description of the survey methods.

2.0 Smoking Status

A. Smoking Behaviour and Brands

From the survey, seven percent of youth smoke cigarettes every day and four percent smoke occasionally. Among youth smokers, 62 percent smoke every day and 38 percent smoke occasionally. Older youth, especially those aged 17 to 18 years, are more likely than younger teens to say they smoke cigarettes every day or occasionally.

Among non-smoking youth, one-quarter (25%) say they have at some time tried cigarette smoking, which includes just having a few puffs. Among non-smoking youth who have never tried smoking, not even a few puffs, five percent say they have seriously thought about trying smoking. Among all non-smoking youth, two percent say they might try smoking within the next month.

Of the youth sample, 11 percent are smokers and 89 percent are non-smokers. Of all youth, 26 percent can be classified as potential smokers; among non-smoking youth, 29 percent can be classified as potential smokers. Potential smokers include any youth who say they have tried smoking, have seriously thought about smoking or think they might try smoking within the next month.

Cigarette Consumption Per Day

	DEC 2000	MAR-APR 2001	JULY 2001	NOV-DEC 2001	JULY 2002	DEC 2002	JULY-AUG 2003	DEC 2003	NOV-DEC 2004

O.1

* Less than one percent

At the present time, do you smoke cigarettes (manufactured or roll your own) every day, occasionally or not at all?

One in ten Canadian youth (10%) report having smoked at least 100 cigarettes in their life. This number is more than twice as high among older youth, aged 17 to 18 years.

Among youth smokers who smoke every day, a total of 27 percent report smoking more than 15 cigarettes per day; including five percent who report smoking more than 25 cigarettes per day. About four in ten (42%) say they smoke between ten and 15 cigarettes per day, and about three in ten (31%) report smoking fewer than ten cigarettes per day.

Among youth smokers who smoke occasionally, nine in ten (90%) report smoking fewer than ten cigarettes per day on the days that they smoke, six percent smoke between ten and 15 cigarettes per day, and five percent smoke more than 15 cigarettes per day.

Among youth smokers, DuMaurier King Size (11%) and Export "A" Regular Size (10%) are most often mentioned as their regular brands of cigarettes. Smaller proportions mention DuMaurier Regular Size (7%), Player's Light Regular Size (6%), DuMaurier Light King Size (4%) and DuMaurier Light Regular Size (4%). Fifty-three percent mention some other brand, and seven percent say they do not have a regular brand.

When youth smokers are asked if they smoke any other brands of cigarettes, 47 percent say they do not smoke any other brand.

Cigarette Consumption Per Day Everyday Smokers

	Dec 2000	Mar-Apr 2001	July 2001	Nov-Dec 2001	July 2002	DEC 2002	July-Aug 2003	Dec 2003	Nov-Dec 2004

Q.;

On the days that you smoke, about how many cigarettes do you smoke?

Subsample: Smoke occasionally

¹ These numbers should be interpreted with caution, due to small sample size (N=46).

B. Quit Attempts and Potential Quitters

Seven in ten youth smokers (69%) report having tried to quit smoking; three in ten (31%) have not tried to quit.

Among youth smokers who have tried to quit smoking,² about nine in ten (92%) say they have stopped smoking for a period of 24 hours at least once in the past year, in an attempt to quit. Eight percent say they have not attempted to quit smoking in the past year.

Quit Attempts

Smokers

dk/na	1	_	_	1	_	2	1	1	-

Q.10

In the past year, how many times have you stopped smoking for at least 24 hours because you were trying to quit smoking? Subsample: Smokers who have tried to quit smoking

ENVIRONICS

² These numbers should be interpreted with caution, due to small sample sizes (N=80).

About six in ten youth smokers (62%) report they are now seriously thinking of quitting smoking; about four in ten (38%) say they are not.

Among youth smokers who are seriously thinking about quitting smoking,³ almost five in ten (46%) say they will try to quit within the next 30 days. A similar number (45%) say they will try to quit within the next six months. Nine percent say they will not try within the next six months.

There has been no significant change since December 2003 in the number of youth smokers who have tried to quit or who say they are seriously thinking of quitting. The current results also suggest no significant change in the number of potential quitters who think they will try to quit within 30 days.⁴

Potential Quitters

Smokers

Q.11b

When do you think you will try to quit?

Subsample: Smokers who are seriously thinking of quitting smoking

³ These numbers should be interpreted with caution, due to small sample sizes (N=73).

⁴ The sample of potential quitters is small (N=73); this finding should be viewed with caution.

Among youth smokers who are seriously thinking about quitting smoking,⁵ almost five in ten say they will use will power or go cold turkey (47%) to try to quit smoking. Smaller numbers say they would chew gum/candy/food (20%), use the nicotine patch (13%), use nicotine gum (12%), cut back gradually (9%), or avoid other smokers and situations involving smoking (7%). Twelve percent mention some other ways or methods, and ten percent offer no opinion.

Ways to Quit Smokers

Q.11c

If you were to quit smoking at some point in the future, what ways or methods do you think you would use? Subsample: Smokers who are seriously thinking of quitting smoking

⁵ These numbers should be interpreted with caution, due to small sample sizes (N=73).

3.0 HEALTH EFFECTS OF SMOKING

A. General and Top-of-mind Effects

About nine in ten youth (88%) think that cigarette smoking is a major health problem in Canada. Eleven percent think it is a minor problem. Only one percent think it is not a health problem.

The results of the current survey are essentially the same as those found in the previous surveys.

The view that smoking is a major health problem is slightly lower among boys.

When asked what specific human health effects or diseases can be caused by smoking cigarettes, youth are most likely to mention lung cancer (57%). Smaller proportions mention cancer in general (38%), heart attack/disease/angina (17%), lung disease (17%), oral cancer – tongue, lips, mouth, throat (12%), emphysema (8%), gum disease/tooth loss/mouth disease (6%), respiratory problems/difficulty breathing/shortness of breath (6%), yellow teeth/fingers/effect on appearance (6%) and asthma (5%). Thirty-seven percent mention other human health effects or diseases.

There has been no significant change since December 2003 in these findings. The results of the current survey are similar to those found in December 2000.

Boys are more likely than girls to mention lung cancer and heart attack/disease/angina. Older youth are more likely than others to mention lung cancer, oral cancer and emphysema.

Smoking as a Health Problem

Q.13
What specific human health effects or diseases, if any, can you think of that can be caused by smoking cigarettes? Are there any others?

B. Sources of Information about Health Effects

When asked where they have recently seen or heard information that talks about the health effects of smoking cigarettes, the largest proportions of youth mention school/university (54%) and television (45%). This is followed by mention of cigarette packages (19%), word-of-mouth/family/friends (15%), magazines (8%), newspapers (6%) and Internet/website (5%). Twenty-five percent mention other sources of information and eight percent say nowhere.

The results of the current survey find that the number of youth who have seen information about the health effects of smoking cigarettes on cigarette packages is essentially unchanged from December 2003, but remains a total of six points higher than in December 2000.

Girls are more likely than boys to have seen or heard this information in school/university or by word-of-mouth. Older youth and youth smokers are more likely than others to have

seen this information on cigarette packages. Older youth are also more likely to mention magazines and television. Youth aged 12 to 16 are more likely to mention school/university. Among non-smokers, potential youth smokers are more likely to mention cigarette packages. Smoking youth are less likely to mention school/university.

Q.14

Thinking generally about information which talks about the health effects of smoking cigarettes, where have you seen or heard any of this kind of information recently? Anywhere else?

In this section of the survey, respondents were read a list of health effects and diseases, and were asked the extent to which they agreed or disagreed that each can be caused by smoking cigarettes.

An overwhelming majority of youth strongly agree that lung cancer (96%) can be caused by smoking cigarettes. Large majorities strongly agree that smoking can cause heart disease (77%), gum or mouth diseases (77%), mouth cancer (73%), throat cancer (72%), asthma (70%) and premature death (67%).

About one-half of youth strongly agree that smoking can cause stroke (55%), smaller babies or reduced growth of babies during pregnancy (53%), wrinkles and premature aging (51%) and chronic bronchitis (49%).

Fewer than half of youth strongly agree that smoking can cause blood clots (42%), premature birth or preterm birth (40%), emphysema (38%), miscarriages (36%), impotence in men (29%), stomach ulcers (26%) and infertility (24%). Two in ten or fewer strongly agree that smoking can cause bladder cancer (20%), Multiple Sclerosis (14%), acne (14%), Alzheimer's Disease (13%), arthritis (12%), gangrene (11%) and hepatitis (10%).

The results of the current survey suggest that there have been slight increases from the December 2003 survey in the proportions of youth who strongly agree that blood clots, stroke and premature death can be caused by smoking. Comparison with the baseline survey in December 2000 suggests that there have been increases in the numbers of Canadian youth who strongly agree that blood clots, premature death, impotence in men, infertility, mouth cancer, gum or mouth diseases, and stroke can be caused by smoking.

Among youth, girls are more likely than boys to strongly agree that smoking can cause gum and mouth diseases, miscarriages, smaller babies or reduced growth of babies during pregnancy, premature birth or preterm birth, and wrinkles and premature aging. Boys are more likely to strongly agree that smoking can cause emphysema, impotence, gangrene, bladder cancer, throat cancer and premature death.

Older youth are more likely to strongly agree that smoking can cause many of these human health conditions, including asthma, emphysema, impotence in men, infertility, mouth cancer, throat cancer, lung cancer, stroke, wrinkles and premature aging, smaller babies or reduced growth of babies during pregnancy, premature birth, premature death and chronic bronchitis.

Those who have seen, read or heard about the health warning messages now on cigarette packages, and those who have seen the messages on cigarette packages themselves, are more likely than those who have not to strongly agree that smoking can cause mouth cancer, throat cancer and premature birth. Those who have seen, read or heard about the health warning messages are also more likely to mention emphysema; those who have seen the messages on cigarette packages are also more inclined to mention miscarriages, gum and mouth diseases, and chronic bronchitis.

Among non-smoking youth, potential smokers are more likely to strongly agree that smoking can cause impotence in men, emphysema and mouth cancer, but they are more likely to strongly disagree that smoking can cause arthritis, hepatitis and acne. Youth smokers are more likely than others to strongly agree that smoking can cause throat cancer, infertility, premature birth and impotence in men, but they are more likely to strongly disagree that smoking can cause arthritis, gangrene and acne.

Q.15

Specific Health Effects Caused by Second-hand Smoke

In this section of the survey, respondents were read a list of health effects in non-smokers, and were asked about the extent to which they agreed or disagreed that each can be caused by second-hand smoke.

Majorities of youth strongly agree that second-hand smoke can cause lung cancer in non-smokers (67%) and asthma attacks in children (66%). About one-half strongly agree it can cause chest infections (55%) and bronchitis (49%) in children and heart disease (46%) in non-smoking adults. Smaller proportions strongly agree that second-hand smoke can cause strokes (30%) in non-smoking adults, SIDS (Sudden Infant Death Syndrome) or crib death (26%), ear infections in children (14%), or Multiple Sclerosis (10%), Alzheimer's Disease (10%) and arthritis (8%) in non-smoking adults.

The results of the current survey indicate a slight increase since December 2003 in the proportion who strongly agree that second-hand smoke can cause strokes. Comparison with the baseline survey of December 2000 suggests that there have been increases in the proportions of youth who strongly agree that second-hand smoke can cause lung cancer in non-smokers, and heart disease and strokes in non-smoking adults.

Among youth, girls are more likely than boys to strongly agree that second-hand smoke can cause chest infections in children. Older youth are more likely than others to strongly agree that second-hand smoke can cause asthma, chest infections, ear infections and bronchitis in children.

Those who have seen, read or heard about the health warning messages now appearing on cigarette packages are more likely to strongly agree that second-hand smoke can cause asthma attacks and bronchitis in children; they are less likely to strongly agree

that second-hand smoke can cause strokes. Those who have seen the messages on cigarette packages are more inclined to agree strongly that bronchitis in children can be caused by secondhand smoke.

Potential smokers among youth are more likely to strongly agree that second-hand smoke can cause bronchitis in children and lung cancer among non-smokers. Youth smokers are less likely to strongly agree that second-hand smoke causes lung cancer in non-smokers and heart disease among non-smoking adults; they are more likely to strongly disagree that second-hand smoke can cause strokes, arthritis, Multiple Sclerosis and Alzheimer's Disease in non-smoking adults.

E. Health Effects Caused by Hydrogen Cyanide

When asked, top-of-mind, about eight in ten youth (78%) offer no specific health effects or diseases that can be caused by hydrogen cyanide. Another five percent say hydrogen cyanide does not cause any health effects or diseases. Twenty-five percent mention specific health effects or diseases.

The survey finds that the number of youth who say hydrogen cyanide does not cause any health effects or diseases is essentially unchanged from December 2003, and is a total of 19 points lower than that found in December 2000.

Youth smokers are slightly more likely than others to mention specific health effects or diseases in response to this question.

Q.39

What specific health effects or diseases, if any, can you name that can be caused by hydrogen cyanide? Are there any others?

4.0 HEALTH WARNING MESSAGES

A. Recall and Reads Per Day

An overwhelming number of youth (94%) say they have seen health warning messages on cigarette packages. Youth smokers (99%) express virtually unanimous recall.

The number of youth who say they have seen health warning messages on cigarette packages is essentially unchanged from the previous surveys.

Potential youth smokers are more likely to recall seeing the health warning messages.

Seven in ten youth (69%) say they have seen, read or heard about the health warning messages that are now on cigarette packages in Canada, and another five percent say they may have. Over two in ten (24%) say they have not.

It should be noted that in all surveys conducted since the December 2002 survey, when asked about "health warning messages that are now on cigarette packages in Canada" in this question, respondents were provided with the additional explanatory phrase "that is, the new messages that began appearing on cigarette packages at the beginning of 2001" in order to clarify the meaning of the question.

Recall of Health Warning Messages on Cigarette Packages

Q.17

Have you ever seen the health warning messages on cigarette packages?

The number of youth who say they have seen, read or heard about health warning messages is essentially unchanged from the December 2003 survey, and is a total of 41 points higher than that found in December 2000.

Boys, older youth, especially those aged 17 to 18 years, youth smokers and potential youth smokers are more likely to be aware of these health warning messages.

Just over eight in ten youth (83%) say they have seen these health warning messages on cigarette packages themselves. Fewer than two in ten (16%) have not.

The number of youth who say they have seen any of these health warning messages on cigarette packages themselves is essentially unchanged from December 2003 and is a total of 17 points higher than that found in March-April 2001.

Q.18

Have you seen, read or heard anything about the health warning messages that are now on cigarette packages in Canada, that is, the new messages that began appearing on cigarette packages at the beginning of 2001?

Note: Slightly different question wording as of December 2002

^{*} December 2000 question referred to "health warning messages that might appear on cigarette packages in the future"

Youth smokers and potential youth smokers are more likely to say they have seen the health warning messages on cigarette packages themselves.

Among youth smokers, almost nine in ten (86%) say they have seen these health warning messages on their main brand of cigarettes. Thirteen percent have not.

The current survey finds no significant change from December 2003 in the number of youth smokers who say they have seen these health warning messages on their main brand of cigarettes; this proportion is 12 points higher than that found in March-April 2001.

^{*} Less than one percent

Q.19

Have you seen any of these health warning messages on any cigarette packages themselves?

Note: Slightly different question wording as of December 2002

Eight percent of youth report that they look at or read health warning messages on cigarette packages several times a day and 13 percent do this about once a day. About six in ten (62%) look at or read these health warning messages less frequently, including 29 percent who say they do this less than once a week. Seventeen percent say they never look at or read these health warning messages.

The results of the current survey are similar to those found in December 2003; there has been a slight decline since December 2000 in the number who look at or read health warning messages several times a day; this decline is greater among youth smokers than among youth in general.

Youth smokers are more likely than others to say they look at or read these health warning messages several times a day. Potential youth smokers, those who have seen, heard or read about the health warning messages now appearing on cigarette packs, and those who have seen these messages on cigarette packages themselves, are more likely than those who have not seen these messages to say they look at or read these health warning messages at least once a day.

Q.21a

Overall, about how often do you find yourself looking at, or reading health warning messages on cigarette packages? Would it be ...?

When asked, top-of-mind, what the health warning messages now appearing on cigarette packages in Canada look like (without looking at a cigarette package), the largest proportion of Canadian youth say they have pictures (35%). About one-quarter (24%) say they have more information than before or more information about the health effects of smoking. Smaller numbers of Canadian youth mention lung cancer/diseases (10%), mouth/teeth pictures/diseases (8%), pictures of lungs (6%), pictures of pregnant women/pregnancy (6%), graphics that are gross (5%), children/babies/kids (5%) and writing/text in general (5%). Fifty-seven percent mention some other aspect and 12 percent offer no opinion.

It should be noted that in previous surveys, respondents were asked about "new health warning messages" in this and other questions dealing directly with the awareness, content, or effect on behaviour of these messages. In surveys conducted since the December 2002 survey, this wording was altered to refer to "health warning messages that are now on cigarette packages in Canada" in all of these questions, in order to clarify the meaning of the question.

The results of the current survey suggest decreases from December 2003 in the numbers of youth who mention lung cancer/diseases and dangerous/bad for health. Comparison with the March-April 2001 survey shows a decline of 18 points in the number of youth mentioning pictures in general; at the same time, there has been a trend toward increased mentions of specific images, ideas or graphics elements, most notably mouth/teeth pictures/disease, pictures of pregnant women/pregnancy, children/babies/kids and lung cancer/diseases.

Girls are more likely than boys to mention pictures of pregnant women. Older youth, particularly those aged 17 to 18 years, are more likely to mention that the current health warning messages on cigarette packages have pictures, and that they have more information than before or more information about the health effects of smoking. Those who have seen, heard or read about the health warning messages now on cigarette packages, and those who have seen these messages on cigarette packages themselves, are also more likely than others to mention that they have pictures and more information. Youth smokers are more likely to mention more information and heart disease. Potential youth smokers are more likely to mention pictures.

Q.22

Again, referring to the health warning messages that are now on cigarette packages in Canada and without looking at a cigarette package, what do these health warning messages look like? Note: Slightly different question wording as of December 2002

When asked, top-of-mind, what specific health warning messages they can remember seeing on cigarette packages in Canada (without looking at a cigarette package), the largest proportion of youth recall the messages mentioning lung cancer (24%). Other recalled messages include harmful during pregnancies, harmful to fetus or low birth rate (11%), impotence (10%), cancer in general (9%), heart disease (7%), harmful to others/children (6%), lung disease (6%), mouth or gum disease (6%), death/premature death (6%), second-hand smoke is harmful/dangerous (5%) and kids are imitating their parents (5%). Thirty percent mention some other health warning message. A total of almost four in ten say none (25%) or offer no opinion (11%).

Since December 2003, there have been decreases in the numbers of youth who mention lung cancer, harmful to others/children and second-hand smoke is dangerous/harmful. The current results also indicate an increase in the number of youth who say they can remember none of these messages. Comparison with the March-April 2001 survey suggests increases in the numbers who mention causes lung cancer and kids are imitating parents and second-hand smoke is harmful/dangerous, and declines in the numbers who mention impotence, harmful to others/children, harmful during pregnancies and death/premature death.

Girls are more likely than boys to mention the message harmful during pregnancies and harmful to others/children; boys are more likely to mention impotence and cancer in general. Older youth are more likely to mention the messages regarding impotence, harmful during pregnancies, heart disease and causes lung cancer. Youth smokers and potential smokers are more likely to mention impotence; potential smokers are also more likely to mention mouth/gum disease.

Those who have seen, read or heard about the health warning messages now on cigarette packages, and those who have seen these messages on cigarette packages themselves, are more likely than those who have not mention causes lung cancer and impotence; those who have seen the messages on cigarette packs are also more likely to mention harmful during pregnancies/harmful to fetus.

Q.23
Without looking at a cigarette package, when it comes to the health warning messages that are now on cigarette packages, what specific health warning messages can you remember? Are there any others?
Note: Slightly different question wording as of December 2002

When asked, top-of-mind, what pictures, images or graphics they can remember seeing on the health warning messages now on cigarette packages in Canada (without looking at a cigarette package), the largest proportion of youth recall lungs or diseased lungs (38%). Other recalled images include bad, rotten or big teeth (21%), pregnant women/with cigarettes (19%), heart or diseased heart (14%), children, kids or babies (11%), mouth or diseased mouth (9%), brain or diseased brain (7%), gums or diseased gums (6%), cigarette/curved cigarette (5%) and lung cancer (5%). Forty-three percent recall other images or graphics. About two in ten say none (13%) or offer no opinion (5%).

The results of the current survey suggest slight decreases since December 2003 in the numbers who mention kids/children/babies and mouth/diseased mouth. Since March-April 2001,

there have been increases in the numbers of youth recalling messages such as lungs or diseased lungs, pregnant women/with cigarettes, cigarette/curved cigarette and bad/rotten/big teeth; there have been decreases in the numbers who mention children/kids/babies, brain/diseased brain and limp/broken/burning cigarettes. As well, there has been a decrease of ten points in the number who say they cannot recall any pictures or image ("none").

Boys are slightly more likely than girls to recall brain/diseased brain; girls are more likely to recall pregnant women/with cigarettes, lungs/diseased lungs and bad/rotten/big teeth. Older youth aged 17 to 18 years are also more likely to recall bad/rotten/big teeth.

Youth smokers are more likely to recall heart/diseased heart. Potential smokers are more likely to recall bad/rotten/big teeth, pregnant women/with cigarettes and mouth/diseased mouth.

Those who have seen, read or heard about the health warning messages now on cigarette packages, and those who have seen these messages on cigarette packages themselves, are more likely than those who have not to recall heart/diseased heart, lungs or diseased lungs, and bad, rotten or big teeth. Those who have seen these messages on cigarette packages themselves are also more likely to mention pregnant women/with cigarettes and children/babies/kids.

And without looking at a cigarette package, when it comes to the warning messages that are now on cigarette packages, what pictures or images or graphics can you remember? Are there any others? Note: Slightly different question wording as of December 2002

Q.24

B. Impact of Current Messages

Among youth smokers, five in ten (48%) say that the health warning messages now on cigarette packages have been very effective in informing them about the health effects of cigarette smoking. About two in ten each say that these messages have been very effective in getting them to smoke less around others than they used to (23%), getting them to smoke less (23%), increasing their desire to quit smoking (19%) and getting them to try to quit smoking (17%).

Combining the numbers who say very and somewhat effective, 78 percent of youth smokers say the messages now on cigarette packages have been effective overall in informing them about the health effects of cigarette smoking; smaller proportions say they have been effective in increasing their desire to quit smoking (55%), in getting them to smoke less around others than they used to (48%), getting them to try to quit smoking (46%) and getting them to smoke less (44%).

The current survey suggests that there has been an increase from December 2003 in the number of youth smokers who say the current health warning messages have been very effective getting them to smoke less. Compared to March-April 2001, the number who say the labels have been very effective in informing them about the health effects of smoking has increased; the current results also suggest a decrease in the number who say these messages have been very effective in increasing their desire to quit. These results should be interpreted with caution due to the small sample size of youth smokers.

Q.26

Thinking about the health warning messages that are now on cigarette packages, have these messages been very effective, somewhat effective, not very effective or not at all effective in each of the following ways ...?

Subsample: Smokers

Note: Slightly different question wording as of December 2002

c. Assessment of Current Messages

Just over seven in ten youth strongly agree that the health warning messages now on cigarette packages provide them with important information about the health effects of smoking cigarettes (73%). Almost seven in ten strongly agree that these messages are accurate (67%), and six in ten strongly agree that these messages make smoking seem less attractive (59%).

Combining the numbers who strongly and somewhat agree, almost all youth agree that the messages provide them with important information about the health effects of smoking cigarettes (95%) and that the messages are accurate (93%). Eight in ten youth agree that the health warning messages make smoking seem less attractive (81%).

The results of the current survey are similar to those found in December 2003; the current results are also similar to those found in March-April 2001 when two of these questions (dealing with informativeness and accuracy) were first asked; the results of the third question (dealing with attractiveness) are similar to that found in November-December 2001, when it was first asked.

Older youth are more likely to strongly agree that the messages are accurate and that they make smoking seem less attractive. Non-smoking youth are also more likely to strongly agree that the messages make smoking seem less attractive.

Those who have seen, read or heard about the health warning messages now on cigarette packages, and those who have seen these messages on cigarette packages themselves, are more likely to strongly agree on all three dimensions.

Q.25

Thinking generally about the health warning messages that are now on cigarette packages in Canada, do you strongly agree, somewhat agree, somewhat disagree or strongly disagree with each of the following statements ...?

Note: Slightly different question wording as of December 2002

D. Avoidance of Messages

When asked about specific behaviours in the last month intended to avoid looking at or thinking about the health warning labels, 21 percent of youth smokers say that they have done so by keeping the pack out of sight, 18 percent say they have done this by transferring cigarettes to another container, 18 percent say they have done this by placing a case or cover over their package, and 16 percent say they have done this by avoiding buying packs with particular health warning messages on them.

The current results suggest a slight decrease from December 2003 in the number of youth smokers who have avoided looking at or thinking about the health warning labels by avoiding buying packs with particular health warning messages on them. Comparison with the findings of the July-August 2003 survey, when the question was first asked, suggests that there may be slight increases in the numbers of youth smokers who transferred cigarettes to another container, or placed a cover or case over their pack. These results should be interpreted with caution due to the small sample size of youth smokers.

Q.27

In the last month, have you made any effort to avoid looking at or thinking about the health warning labels by doing any of the following ...?

Subsample: Smokers

5.0 SLIDE AND INSERT

A. Recall and Reads per Day of Slide

When asked, top-of-mind, if they can recall or describe anything they saw or read on the back of the slide portion of a cigarette package (without looking at a cigarette package), just over eight in ten Canadian youth either offer no opinion (43%) or say they have not seen the slide portion (40%). Four percent mention tips to stop smoking and 15 percent mention other items.

Since December 2003, there has been an increase in the number of youth who have not seen the slide portion of a cigarette package. Comparison with the results found in December 2002, when this question was first asked, also indicate a slight increase in the number of youth who have not seen the slide portion of a cigarette package

Youth smokers are more likely than others to recall tips to stop smoking. Older youth, youth smokers and potential youth smokers are less likely to say they have not seen the slide portion.

Q.28

Without looking at a cigarette package, can you recall or describe anything you saw or read on the back of the sliding part of a cigarette package? Anything else?

Five percent of youth smokers report that they look at or read the information on the slide several times a day, and four percent do this about once a day. Almost five in ten (a total of 47%) look at or read the information on the slide less frequently, including 25 percent who say they do this less than once a week. About four in ten (42%) say they never look at or read the information on the slide.

The current results are similar to those found in December 2003; comparison with the July-August 2003 results suggest a slight decrease in the number who look at the information on the slide less than once a week. These results should be interpreted with caution due to the small sample size of youth smokers.

Look at or Read Information on Back of Cigarette Pack Slide Smokers

	July-Aug 2003	December 2003	Nov-Dec 2004
Several times a day	2	5	5
About once a day	8	6	4
Once every two or three days	4	5	9

dk/na	_	_	2

Q.29

Overall, how often to you find yourself looking at or reading the information on the back of the sliding part of a cigarette package? Would it be ...?

Subsample: Smokers

B. Assessment of Information on Slide

Almost five in ten (47%) youth smokers strongly agree that the information they have seen on the back of the slide is accurate, and almost four in ten (37%) strongly agree that the information is useful to them. Combining the strongly and somewhat agree numbers, 72 percent of youth smokers agree the information is accurate, and 68 percent say it is useful to them.

The results of the current survey suggest that since December 2003, there have been slight increases in the number of youth smokers who strongly agree on both of these dimensions. Comparison with the results found in December 2002, when the question was first asked, suggests that the number of youth smokers who strongly agree the information is accurate may have declined. However, these results should be interpreted with caution due to the small sample size of youth smokers.

Messages on Back of Slide Smokers

	Dec 2002	July-Aug 2003	Dec 2003	Nov-Dec 2004

dk/na	15	17	12	12

Q.30

Thinking about the information you have seen or read on the back of the sliding part of a cigarette package, do you strongly agree, somewhat agree, somewhat disagree or strongly disagree with each of the following statements ...?

Subsample: Smokers

c. The Insert

Three percent of youth smokers report that they look at or read the information on the insert several times a day, and two percent do this about once a day. Almost four in ten (a total of 37%) look at or read the information on the insert less frequently, including 23 percent who say they do this less than once a week. More than five in ten (55%) say they never look at or read the information on the insert.

The current results suggest little change since December 2003, but there has been a slight increase in the number who look at the information on the insert less than once a week. The current results are similar to those found in July-August 2003, when this question was first asked. However, these results should be interpreted with caution due to the small sample size of youth smokers.

Forty-five percent of youth smokers throw out the insert when they open the pack, and another 27 percent throw out the insert when they are finished with the pack. Only four percent keep the insert, and ten percent say they do something else with it. Eleven percent say they do not have inserts in their packs of cigarettes.

The current results are similar to those found in December 2003, and in July-August 2003, when this question was first asked. These results should be interpreted with caution due to the small sample size of youth smokers.

Awareness of Toxic Substances

When youth are asked, top-of-mind, what, if any, chemicals or toxic substances they can name that are in cigarettes or cigarette smoke, the largest proportions mention tar (42%) and nicotine (38%). Fourteen percent mention tobacco, seven percent mention poison/rat poison/strychnine/cyanide and seven percent mention carbon monoxide. Thirty percent mention other toxic substances. Twenty-two percent offer no opinion.

Since December 2000, there have been slight decreases in the numbers of youth mentioning tar and nicotine, and a slight increase in the number mentioning tobacco. The results suggest that there may be a trend over the same period toward somewhat more frequent mentions of specific toxic chemical substances such as hydrogen cyanide, formaldehyde and ammonia.

Boys are more likely than girls to mention nicotine and tar. Older youth and youth smokers are more likely to mention nicotine, tar and carbon monoxide; youth aged 12 to 14 years are more likely to mention tobacco. Youth smokers are also more likely to mention benzene and hydrogen cyanide. Potential youth smokers, and those who have seen, read or heard about the health warning messages now on cigarette packages, and those who have seen these messages on cigarette packages themselves, are more likely to mention nicotine and tar.

Q.33

Without looking at anything, what, if any, chemicals or toxic substances can you name that are in cigarettes or cigarette smoke? Are there any others?

When asked what chemicals or substances in cigarettes, in tobacco or in smoking, if any, cause or can cause disease or harm to health, the largest proportions of youth mention tar (22%) and nicotine (21%). Smaller proportions mention tobacco (4%) and carbon monoxide (4%). Ten percent say that all the chemicals cause harm, and 16 percent mention other specific substances. Forty-eight percent offer no opinion.

The current survey results show a decrease from December 2003 in the number of youth who mention nicotine. The current results are similar to those found in July 2002, when the question was first asked.

Boys and potential smokers are more likely to mention tar. Older youth, youth smokers, those who have seen, read or heard about the health warning messages now on cigarette packages, and those who have seen the health warning messages on cigarette packages themselves, are more likely than others to mention tar and nicotine. Older youth are also more likely to say that all the chemicals cause harm. Youth smokers are also more likely than others to mention carbon monoxide.

Q.37

What chemicals or substance in cigarettes, in tobacco or in smoking, if any, causes or can cause disease or harm to health? Are there any others?

More than six in ten youth (64%) think that chemicals are added to tobacco when cigarettes are being manufactured. Fewer than two in ten (16%) say that chemicals are not added, and two in ten (20%) offer no response.

The results of the current survey are similar to those found in December 2003, and also to those found in July 2002, when the question was first asked.

Boys, older youth, potential smokers, those who have seen, read or heard about the health warning messages now on cigarette packages, and those who have seen the health warning messages on cigarette packages themselves, are more likely than others to say that chemicals are added to tobacco.

Q.38

Q.37

As far as you know, are any chemicals added to the tobacco when cigarettes are manufactured?

B. Reads per Day and Impact of Information about Toxic Substances

Four percent of youth smokers report that they look at or read the information about chemicals and substances on the side of a cigarette package several times a day, and two percent do this about once a day. More than four in ten (a total of 45%) look at or read the information on the side of the package less frequently, including 31 percent who say they do this less than once a week. Five in ten (50%) say they never look at or read the information on the insert.

These results are similar to those found in December 2003 and in July-August 2003, when this question was first asked; however, the current results suggest a slight increase in the number of youth smokers who say they never look at the information on the side of the package. These results should be interpreted with caution due to the small sample size of youth smokers.

When asked if they can name any chemicals or toxic substances that are currently listed on a cigarette package (without looking at a cigarette package), the largest proportions of youth mention nicotine (16%) and tar (14%). Fourteen percent mention some other toxic substance. Eight percent say there are no chemicals or toxic substances currently listed on cigarette packages, and 63 percent offer no opinion.

The current survey results suggest that there have been slight decreases since December 2003 in the number of youth who say that tar and nicotine are listed on cigarette packages, and an increase in the number who offer no opinion. Since December 2000, there has been a decrease of 14 points in the number of youth who say there are no toxic substances listed on cigarette packages and an increase of 20 points in the number who offer no response to the question; there have also been decreases in the numbers who mention tar, nicotine and carbon monoxide.

Boys, older youth, particularly those aged 17 to 18 years, those who have seen, read or heard about the health warning messages that are now on cigarette packages, those who have seen these messages on cigarette packages themselves and youth smokers are more likely to mention nicotine and tar; youth smokers are also more likely to mention hydrogen cyanide, benzine and carbon monoxide.

Fewer than one-half of youth smokers say that the information about chemicals and toxic substances now on the side of cigarette packages has contributed to encouraging them to

Look at or Read Information about Chemicals and Substances on Side of Cigarette Pack Smokers

	July-Aug 2003	Dec 2003	Nov-Dec 2004
Several times a day	1	5	4
About once a day	4	5	2
Once every two or three days	5	4	3
About once a week	15	15	11
Less than once a week	30	31	31

Q.35

Overall, how often do you find yourself looking at, or reading, the information about chemicals and substances on the side of cigarette packages? Would it be ...? Subsample: Smokers

try to quit smoking (43%). About one-third each say that this information has contributed to getting them to smoke less (37%) and increasing their desire to quit smoking (34%). Fewer than two in ten (14%) say the information has contributed to getting them to switch to a different brand or product.

Since December 2002, there have been decreases on all four dimensions in the numbers who say that the information on the side of cigarette packages has had an impact on their smoking behaviour. These results should be interpreted with caution due to the small sample size of youth smokers.

Q.34

Without looking at a cigarette package, can you name any chemicals or toxic substances that are currently listed on a cigarette package in Canada? Can you name any others?

^{**} Prior to Dec. 2002: "Poison/rat poison/strychnine/arsenic"

	Survey Method

Survey of Youth: Methodology

The results of the survey are based on questions asked to 1,000 youth between 12 and 18 years of age, living within the ten provinces of Canada. The survey was conducted by telephone from November 18 to December 5, 2004.

SAMPLE SELECTION

The sampling method was designed to complete approximately 1,000 interviews with youths between 12 and 18 years of age in the ten provinces, proportionate to the incidence of youths of this age group in each province relative to the incidence of youth in the population of Canada. Using population data, the relative proportions of youths of each of these ages in the populations of each province were derived and used as the basis of the sampling frame.

The actual sample is distributed as follows.

	Weighted N	Unweighted N	Margin of Error
Atlantic Region	81	82	10.8
Quebec	252	250	6.2
Ontario	374	374	5.1
Manitoba/Saskatchewan	71	70	11.7
Alberta	91	93	10.2
British Columbia	131	131	8.6
Total	1,000	1,000	3.1

Environics uses a sampling method in which sample is generated using the RDD (random digit dialling) technique. Samples are generated using a database of active phone ranges. These ranges are made up of a series of contiguous blocks of 100 contiguous phone numbers and are revised three to four times per year after a thorough analysis of the most recent edition of an electronic phonebook. Each number generated is put through an appropriate series of validation procedures before it is retained as part of a sample. Each number generated is looked up in a recent electronic phonebook database to retrieve geographic location, business indicator and "do not call" status. The postal code for listed numbers is verified for accuracy and compared against a list of valid codes for the sample stratum. Non-listed numbers are assigned a "most probable" postal code based on the data available for all listed numbers in the phone exchange. This sample selection technique ensures both unlisted numbers and numbers listed after the directory publication are included in the sample.

A total of 38,416 telephone numbers were drawn. From within each household contacted, respondents between 12 and 18 years of age were screened for random selection using the "most recent birthday" method. The use of this technique produces results that are as valid and effective as enumerating all eligible persons within a household and selecting one randomly.

Additional screening was performed to exclude households in which the respondent or another household member was employed in advertising, market research, the media or a tobacco company.

In the data analysis, the results of the survey were weighted to reflect the actual proportion of over- and under-sampled segments in the population: in this case, weighting was by age, gender and region.

TELEPHONE INTERVIEWING

Interviewing was conducted at Environics' central facilities in Toronto and Montreal. Field supervisors were present at all times to ensure accurate interviewing and recording of responses. Ten percent of each interviewer's work was unobtrusively monitored for quality control in accordance with the standards set out by the Canadian Association of Marketing Research Organizations. A minimum of five calls were made to a household before classifying it as a "no answer."

COMPLETION RESULTS

A total of 1,000 interviews were completed. The margin of error for a sample of 1,000 is +/- 3.1 percentage points, 19 times in 20. The margins are wider for regional and demographic subsamples.

The following table presents the detailed completion results for this survey of 1,000 interviews.

Survey of Youth - Wave 9 PN5552 Questionnaire - Draft 1

INTRODUCTION FOR YOUTH SURVEY

for sel	llo, my name is of Environics Research Group Ltd. We are conducting a study the Government of Canada on issues important to Canadians. Please be assured that we are not ing or soliciting anything. Your answers will be kept strictly confidential and your participation is cortant if the results of the survey are to be accurate.
	choose telephone numbers at random, then select one person from a household to be erviewed. In this survey we are speaking to people between 12 and 18 years old.
Α.	May I please speak to the person in your household who is between 12 and 18 years old who has had the most recent birthday.
	#01 Yes #02 Not AvailableSCHEDULE CALL-BACK #03 RefusedDISCONTINUE & THANK
В.	Do you or does anyone in your household work for an advertising or market research firm, the media, or a tobacco company?
	1 - Yes THANK AND TERMINATE 2 - No
C.	(READ IF NECESSARY) Are you male or female?
	1 - Male 2 - Female
D.	Language of survey
	1 - English 2 - French

E. How old are you?

F. To what age group do you belong?

- 1 12 to 14 years old
- 2 15 to 18 years old
- 3 DK/NA

Parental consent requested of some youth categories.

MAIN QUESTIONNAIRE

1. At the present time, do you smoke cigarettes (manufactured or roll your own) every day, occasionally or not at all?

1 - Every day	SMOKER - GO TO Q.5
2 - Occasionally (less than every day)	SMOKER - GO TO Q.5

3 - Not at all
4 - DK/NA
NON- SMOKER - GO TO Q.2
NON- SMOKER - GO TO Q.2

ASK ALL NON-SMOKERS

2. Have you ever tried cigarette smoking, even just a few puffs?

1 - Yes	SKIP TO Q.4
2 - No	GO TO Q.3
3 - DK/NA	GO TO Q.3

IF RESPONDENT HAS NOT EVER TRIED SMOKING IN Q.2 OR DK/NA, ASK:

3. Have you ever seriously thought about trying smoking?

- 1 Yes
- 2 No
- 3 DK/NA

ASK ALL NON-SMOKERS

4. Do you think you might try smoking within the next month?

- 1 Yes
- 2 No
- 3 DK/NA

ASK ALL	
5. Have you	a smoked at least 100 cigarettes in your life?
	1 - Yes
	2 - No
	3 - DK/NA
NON- SMO	OKERS GO TO Q.12
	EVERY DAY, ASK:
	age, how many cigarettes do you smoke per day?
	FOR A PRECISE NUMBER. IF RESPONDENT SAYS ONE PACK A ROBE FOR NUMBER OF CIGARETTES IN A PACK
	cigarettes per day (response must be numerical - do not accept range)
	2 - DK/NA

7.	On the days that you sm	oke, about how many cigarettes do you smoke?
